Abstract

This cruise report contains water column CTD data collected in Clayoquot Sound, British Columbia, Canada. Data was collected between September 5-14, 2007 aboard the R/V Clifford A. Barnes. The objectives of the cruise were to explore the factors that control organic matter remineralization in the water and preservation in the sediment, collect sediment and settling particles for organic analyses back in the lab at the School of Oceanography, University of Washington, Seattle, and to relate water column properties (e.g. oxygen content, temperature) and remotely derived information (satellite and aerial data) to carbon cycling in the fjords. Student researchers collected sediment and particulate samples within the oxygen minimum zone of Tranquil Inlet at the head of Tofino Inlet.

Introduction

The scientific objectives of the September 2007 cruise to Clayoquot Sound, Vancouver Island included various efforts related to organic carbon cycling in the inlets. Evaluations were made of water column conditions (temperature, density, oxygen content, chlorophyll fluorescence, etc.) within the inlets and sampling near surface light conditions for comparison with satellite/aerial data. To accomplish these goals, several types of measurements were made; CTD casts, multicore sediment grabs, water samples and incubations, plankton samples and near surface light characteristics. Data from the nutrient, chlorophyll, plankton, bacteria and satellite/aerial groundtruthing samples are being analyzed. CTD measurements were made at more than forty stations throughout Clayoquot Sound (Figure 1). Water samples were collected at many stations and bacterial growth rates measured using ^{3}H -thymidine. At two stations, numbered 47 and 48, we deployed the sediment multicorer several times in order to collect sediment for evaluation of stable isotopic compositions of dissolved inorganic carbon. We also deployed a net trap to collect sinking particles at stations 47 and 48.

All inquiries for data should be addressed to Dr. Keil. Cruise participants and their affiliations are listed in Table 1.

The cruise was divided into two legs:

- Leg 1 Sept 5-9 2007: Focused effort in Tofino Inlet to evaluate sediment and water characteristics, and to evaluate coupling between the water and the watershed. Drs. Miles Logsdon and Rick Keil took the lead. We deployed sediment traps in Tofino Inlet near Rankin Rocks and in Tranquil Inlet. Sediment was collected using the multicorer at stations 47 and 48 in Tofino Inlet. We also deployed the weather station and optical spider to record local water and weather conditions and upper water light field data.
- Leg 2 Sept 9-14 2007: Water column survey of all of Clayoquot Sound. Dr. Cheryl Greengrove took the lead. Measurements included water temperature, salinity, density, particle load, oxygen content, nutrients, phytoplankton abundance and identification, bacterial growth rates and water/atmospheric optical conditions. Our purpose was to identify key features that control the abundance of microscopic organisms in the Sound, and identify key physical features of the local ocean that determine water renewal and mixing in the Sound.

Methods

CTD casts were made with a SEABIRD 911plus equipped with an oxygen sensor, fluorometer, transmissometer and PAR sensor and lowered at a rate of 20 m/min. Oxygen samples were collected and run on board using the Winkler titration method (Carpenter 1965). Nutrient samples were collected on 50 ml sample bottles and frozen for analysis by the UW Marine Chemistry Laboratory upon return. Bacterial growth was measured using the thymidine approach of Chin-Leo and Kirchman (1988) and the standard DAPI technique. Light measurements were made with a lightmeter attached to the CTD rosette and surface water characteristics determined by taking surface samples, filtering and storing for future analysis.

The settling trap is described in Peterson et al., 2005. Table 3 presents the CTD data. All times in Table 2 and 3 are local.
